

NAME

sudo_sendlog - send sudo I/O log to log server

SYNOPSIS

sudo_sendlog [-V] [-h *host*] [-i *iolog-id*] [-p *port*] [-r *restart-point*] *path*

DESCRIPTION

sudo_sendlog can be used to send the existing **sudoers** I/O log *path* to a remote log server such as `sudo_logsrvd(8)` for central storage.

The options are as follows:

- help** Display a short help message to the standard output and exit.
- h, --host** Connect to the specified *host* instead of localhost.
- i, --iolog-id** Use the specified *iolog-id* when restarting a log transfer. The *iolog-id* is reported by the server when it creates the remote I/O log. This option may only be used in conjunction with the **-r** option.
- p, --port** Use the specified network *port* when connecting to the log server instead of the default, port 30344.
- r, --restart** Restart an interrupted connection to the log server. The specified *restart-point* is used to tell the server the point in time at which to continue the log. The *restart-point* is specified in the form "seconds,nanoseconds" and is usually the last commit point received from the server. The **-i** option must also be specified when restarting a transfer.
- V, --version**
 Print the **sudo_sendlog** version and exit.

Debugging sendlog

sudo_sendlog supports a flexible debugging framework that is configured via Debug lines in the `sudo.conf(5)` file.

For more information on configuring `sudo.conf(5)`, please refer to its manual.

FILES

`/etc/sudo.conf` Sudo front end configuration
